

Project 2: Quasi-Object

Proposal

This project explores the idea of a quasi-object — a form that does not possess a single, stable identity, but instead becomes “real” only through perception, camera position, and digital interaction. Using Blender, I will design a 3D object whose meaning shifts depending on how it is viewed, lit, or animated. The goal is to create a digital artifact that exists between states: part illusion, part structure, part performance.
